DETAILED ACTION

Allowable Subject Matter

1. Claims 4-13, and 16-17 (renumbered as claims 1-12) are allowed.
2. The following is an examiner's statement of reasons for allowance.

Prior art of record fails to teach or fairly suggest a radio LAN data transmission system, method and program code wherein each independent claim (i.e. claims 8, 9, 16 and 17) requires, inter alia, temporarily storing input data and using a data smoothing unit to smooth the input data to generate output data while the input data is being read from the storage unit and a memory monitoring unit that outputs a completion signal to an access point when reading of all the data stored in the storage unit is finished and a completion signal detecting unit that detects a completion signal output from a memory monitoring unit of the access point.

---(7,187,906) Mason, Jr et al teaches a method and system of establishing a wireless communication network among a plurality of nodes wherein responses are monitored to determine if communication can be made between the plurality of nodes (see col. 20 lines 30-65). However, Mason, Jr et al does not teach temporarily storing data nor needs to use a data smoothing unit to smooth the input data to generate output data while the input data is being read from the storage unit and a memory monitoring unit that outputs a completion signal to an access point when reading of all the data stored in the storage unit is finished and a completion signal detecting unit that detects a completion signal output from a memory monitoring unit of the access point as

required by each independent claim 8, 9, 16 and 17 and depicted as item 305 in figure 6.

---(2006/0218250 Nakase) teaches a wireless LAN wherein storage section (i.e. buffer) is used to temporarily store compressed content information (see paragraph 0056) but does not require a smoothing unit to smooth the input data to generate output data while the input data is being read from the storage unit and a memory monitoring unit that outputs a completion signal to an access point when reading of all the data stored in the storage unit is finished and a completion signal detecting unit that detects a completion signal output from a memory monitoring unit of the access point as required by each independent claim 8, 9, 16 and 17 and generally shown as item 305 in figure 6.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

3. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Barry W. Taylor, telephone number (571) 272-7509, who is available Monday-Thursday, 6:30am to 5pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, William Trost, can be reached at (571) 272-7872. The central facsimile phone number for this group is **571-273-8300**.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the Group 2600 receptionist whose telephone number is (571) 272-2600, the 2600 Customer Service telephone number is (571) 272-2600.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for
